1 Mission

The Extended Semantic Web Conference (ESWC) series is a yearly scientific conference on topics centered on Semantic Technology. Semantic Technology is used to provide machine understandable descriptions of resources (network infrastructure, hardware, and software), data, and processes. Currently the conference encompasses major areas such as:

- **Social Web and Web Science**: The combination of Social Web principles and Semantic Web technologies allows end-users to massively produce and use semantic data through social applications, which in turn enables smarter Web-based applications in various domains. This includes the Social Web itself, where it becomes possible to mine Semantic Web data and discover relationships that were not obvious, whether it is in social network identification or for information retrieval purposes. These can be exploited for various purposes: to personalize applications, recommend content, generate new knowledge, and more. But besides the technical aspect, there is also a need to understand the behaviors and patterns of users on the Web, and in particular on the Social Web. Web science aims to address these issues, also considering other aspects that are important to realize a Social Semantic Web, such as governance, law, policies and decision-making.

- **Ontologies**: Ontologies, and related formal representations of conceptual knowledge, are at the heart of Semantic Technology, with research on ontology languages, the development and maintenance of ontologies, and ontology-based applications representing a core part of the research since the early days of the Semantic Web.

- **Reasoning**: This area involves the management of and reasoning with ontologies and rules, so as to support semantically enabled applications. The central idea of this vision is to use ontologies to encode application data in a machine understandable form, in order to be able to automatically integrate data from different sources and to be able to support semantic search for information based on its meaning rather than its syntactic form, and rules to perform conditional decision, event processing and actions on behalf of the user.

- **Semantic Data Management**: Over the past years we have witnessed a tremendous increase in the amount of semantic data that is available on the Web in almost every field of human activity. For the successful discovery, sharing,
distribution and organization of this emerging information universe, the ability to understand and manage the semantics of the data is of paramount importance. Semantic data management refers to a range of techniques that can be employed for storing, querying, manipulating and integrating data based on its meaning. It essentially enables sustainable solutions for a range of IT environments, where the usage of today’s mainstream semantic technology is either inefficient or entirely unfeasible, namely, enterprise data integration, life science research, and collaborative data sharing in SaaS architectures. In a nutshell, semantic data management aims to support a more comprehensive usage of larger scale and more complex semantic datasets at lower cost. To achieve this vision, interdisciplinary synergies are required among researchers in the Semantic Web, data management systems as well as Information Retrieval communities.

- **Linked Data**: The Linked Data paradigm is meanwhile established as a pragmatic approach for supporting the realization of the Semantic Web vision and providing a fertile soil for integrating a variety of research directions and usage scenarios. For managing the life-cycle of Linked Data on the Web, the stages of extraction, storage, revision, enrichment, repair, quality analysis and consumption of linked Web Data are of particular importance. Particularly, the Linked Open Data (LOD) movement has gained remarkable momentum over the past years. Hundreds of datasets (including governmental, reference, geographic, media, scientific, and social data) have been published, providing tens of billions of RDF triples interlinked by hundreds of millions of RDF links. LOD, as well as complementary open data initiatives, are becoming significant contributors to the information landscape of the Web. The recent advances in both the publication and the consumption of Web Data have increased the potential impact of research contributions in this area.

- **Software, Services and Processes**: The software industry in Europe and beyond is preparing for the Future Internet of Services, which is commonly considered to become a multi-billion market within the next years. Despite the substantial innovations and research results on service engineering throughout the last decade, several challenges need to be solved in order to make the vision of the Internet of Services (IoS) become a reality. To address this, we are particularly interested in scientific contributions for the profitable employment of Semantic Technology for the modeling, handling, and management of business-relevant aspects of services and service-based computing, novel techniques for automating the complete service provision and consumption life cycle in an efficient and large-scale manner, esp. around light-weight RESTful services in addition to the traditional WS-* stack as well as the integration with Web-of-Data technologies;
innovative techniques for easy, light-weight, and efficient service-based application development such as Web 2.0 inspired service mash-up techniques, scalable service composition and the integration with business process and workflow technologies, or service customization and on-device support.

- **Natural Language Processing**: Natural language is the main means of communication between humans and as a result a huge amount of content on the Web is still textual or at least semi-structured, combining some markup (e.g. in the form of tags) with unstructured content. Natural language processing and text mining are therefore crucial building blocks for the semantic analysis of unstructured and textual data and are thus important research areas for the Semantic Web. Natural language can represent an effective and intuitive means for querying and accessing semantic data. This track covers research contributions dealing with all aspects of combining natural language and semantics solving traditional as well as novel challenges.

- **Sensor and Mobile Web**: Millions of sensors are currently deployed in sensor networks around the globe, and are actively collecting enormous amounts of data. Together with legacy data sources, specialized software modules (e.g., modules for mathematical modeling and simulation) and Web 2.0 technologies such as mash-ups, sensor networks give us the opportunity to develop unique applications in a variety of sectors (environment, agriculture, health, transportation, surveillance, public security etc.). Although many of the engineering issues associated with managing sensor network data are solved, managing effective access to this data remains a challenge. Semantic Technology provides, in particular ontologies, but also (stream) reasoning techniques are expected to provide new solutions to this challenge. In addition to sensor data from fixed sensors, modern smart phones and other mobile devices are making ubiquitous computing a reality. They interact directly with our physical environment, and are used in a personalized and contextualized setting. Semantic Technology can help mobile applications developers in the challenging task of managing rich, heterogeneous data about users, their interactions, movements, activities, etc. The correct interpretation and analysis of the raw numerical values provided by pervasive sensor networks and mobile devices now featuring several sensors requires proper semantics support and contextual knowledge; the following aspects seem particularly relevant: (a) identification of simple events or event streams by joining sensor data with background knowledge, (b) identification of complex events composed from several atomic sensed events based on background knowledge, (c) filtering, management, and interpretation of
sensor and mobile data using contextual models, (d) creation of actuators and applications based on sensor data and background knowledge

- **Machine Learning:** With the growing availability of Semantic Web Data, machine learning approaches - in particular inductive learning methods - are increasing in relevance. The prospect is that innovative approaches for (semi-)automatically building and enriching ontologies from information sources such as Linked Data, tagged data, social networks, and ontologies will increasingly support Semantic Web applications. Furthermore, inductive incremental learning techniques can perform reasoning at large scale beyond the limitations of deductive approaches. Finally, machine learning can deal with the intrinsic uncertainty in Web data containing incomplete and/or contradictory information.

- **Semantic Technology in Use:** Bringing the research results down to exploitation by the final users as well as demonstrating the beneficial use of these results in real world settings is a major challenge. Semantic technologies are among transversal enabling technologies, and, hence, can be applied in various domains, ranging from eGovernment to manufacturing. The Semantic Web in Use track is particularly devoted to showcase implemented applications, learned best practices as well as assessments and evaluations of semantic technologies in real world settings. Submissions to this track should substantially contribute to the knowledge transfer from research labs into mainstream adoption. Special interest for this year’s ESWC in use track includes linking open (e.g., government) data, sentiment analysis (e.g., over social networks and blogs) and scalable show cases (e.g., scenarios with large volumes of data and/or near real-time response requirements).

Moreover, the conference includes (annually reviewed) special tracks, comprising special topics of focus interest. As an example, the ESWC2012 special tracks are:

- **Special track 2012: Digital Libraries and Cultural Heritage.** Digital Libraries (DL) are fast becoming significant resources for the world’s knowledge. This is especially true in the Cultural Heritage (CH) sector, e.g., in Libraries, Archives and Museums, where large bodies of digital documents and metadata are being assembled and re-distributed through initiatives like Europeana.eu. But even though a lot content is already accessible via the visible Web, much more could be exploited, and better exploited using Semantic Web technology. Often, Digital Libraries focus on particular disciplinary and subject areas and constitute curated knowledge. Semantic Web techniques for digital libraries will therefore take advantage of much richer assumptions on domain-specific semantics, consistency...
and quality of content. Linked Data technology also offers unprecedented opportunities for data sharing and re-using, within the cultural domain itself, and across a wider range of sectors.

- **Special track 2012: eGovernment: Using Semantics for Promoting Interoperability in the Public Sector.** Public administration is considered the heaviest service industry as well as the most important information provider even in countries with relatively small public sectors. It is also a highly distributed "business", with hundreds or even thousands of different entities providing services and data to other public agencies, businesses and citizens. In this environment, promoting interoperability amongst all these various actors is considered vital for improving responsiveness, efficiency and reducing costs. The European Interoperability Framework introduced four layers of interoperability, technical, semantic, organizational and legal. With the current advancement and the availability of off-the-shelf solutions for addressing technical interoperability issues, the focus has been shifted to semantic interoperability, a layer that has recently received much attention by both researchers and practitioners.

These areas and track are reviewed by the ESWC Steering Committee on an annual basis. Major revisions in this respect require approval by the STI President. Complementary to the International Semantic Web Conference (ISWC), ESWC covers areas beyond the Semantic Web as a truly Semantic Technology conference. To express this character we use the term ‘Extended’ within the conference title. For historical reasons we do not use ‘Semantic Technology’ in order to distinguish the conference from existing industrially oriented events in this area. In contrast with the former European Semantic Web Conference the new event is no longer solely limited to Europe. ESWC has close ties with sister communities in the areas of Artificial Intelligence, Web technology, Data/Text/Web Mining, Natural Language Processing and Very Large Databases. Cooperation and collocation with events in these areas is both desired and encouraged.
2 Structure of the conference

Here we define the overall structure and elements of a single ESWC event.

2.1 Conference Chair

Each conference has a Conference Chair to oversee all activities of a specific ESWC event. He or she must be a senior researcher with an outstanding scientific track record and an appropriate level of organizational skills. The Chair has overall responsibility for all conference matters. As such, the Chair reports directly to the Steering Committee through its President or designate on the planning, progress, operation and final results of the Conference.

A preliminary conference report should be issued and verbally presented to the Steering Committee during its meeting at the Conference. In this report, the Conference Chair should give a synopsis of the attendance, program quality, organization, and explain significant variations with respect to the plans and expectations. A preliminary written financial report must be provided. The Conference Chair or his/her designate must submit a written final conference report to the Steering Committee within three (3) months after the Conference has been held. It should cover the previously mentioned categories and report on all experiences and recommendations useful for organizers of future conferences. The conference report is published on the ESWC web site.

He/she is selected by the Steering Committee. In the last few years the Chair has been selected from the Program Committee Chairs of the former conference. This has proved to aid in the continuity of smooth operation and the transfer of conference specific knowledge.

2.2 Program Committee Chairs

The major scientific track of the conference is prepared by the Program Committee Chairs and the Track Chairs with the help of the Program Committee Members (organized by areas).

Given the nature of the topic there should be minimally two Program Committee Chairs covering the different scientific threads deemed relevant for the current event. The Program Committee Chairs organize the Call for Papers for the conference and provide governance for the overall review process of the papers in the different areas. They approve the PC Members proposed by the Track Chairs. Program Committee Chairs should be senior researchers with outstanding scientific track records.
The Program Committee Chairs are selected by the Conference Chair in conjunction with the Steering Committee.

2.3 Track Chairs
Each area is represented by 1-2 Track Chairs. Track Chairs propose PC members to review the papers submitted to their area. Track Chairs design individual calls for papers and actively promote the possibility to publish and participate in ESWC. Track Chairs organize the reviewing process for the papers submitted to their area under the governance of the general Program Committee Chairs. They organize the relevant sessions during the conference and acquire the final copies of the papers published in the proceedings. Track Chairs should be researchers with a significant scientific track record in their respective areas.

He/she are proposed by the Program Committee Chairs and approved by the Conference Chair.

2.4 PC members
PC Members (PCMs) should have a significant scientific track record in their respective areas and be willing and committed to carefully and fairly evaluate the scientific quality and potential impact of the submitted papers. PC Members (PCMs) are proposed by Track Chairs and approved by the Program Committee Chairs.

Program Committee Chairs should provide information about the mission of the conference (e.g., broadening, thematic focus), policies of paper evaluation, the scheduling of PC work (especially the dates for papers to be available for reviewing and completing reviews, timeframe for e-mail or Web-based discussion of controversial or otherwise specific papers, and the PC meeting date), and other operational procedures (e.g., handling of PC papers) to PC candidates together with the invitation for serving on the PC.

PC members must agree that they will do their best to implement the conference mission and policies. PC members must also agree that they do not serve on any other conference Program Committee Chairs whose critical timeframe between beginning of reviewing and the PC meeting overlaps with the critical timeframe of ESWC.

Program Committee Chairs should select the members of their PCMs based on personal knowledge or strong recommendations on the candidates’:

- technical competence on the important areas to be covered,
• ability to handle papers beyond their core areas of expertise,
• performance in terms of responsiveness and thoroughness, and
• ethical integrity with regard to dedicating time to the conference, keeping the refereeing process confidential, fairness, etc.

Program Committee Chairs should proactively communicate with previous Program Committee Chairs of recent ESWC conferences on experiences with tentative PC members before sending invitations to serve on the PC. Under exceptional circumstances (e.g., an unexpectedly high number of submissions on a specific topic), the PC chairs may “dynamically” extend the PC by a very small number of additional PC members after the submission deadline.

The following recommendations are made regarding the selection of PC members (not in order of priority):

• select people who are not over-committed and who are capable and willing to perform a high quality reviewing job on time;
• try to achieve a good geographical distribution. PC members are excellent channels to advertise the conference and to solicit papers;
• select people who have a good research record and an international recognition in the semantic technology area and/or related areas;
• try to involve “new faces”. One of the reasons for the success of the ESWC conference series is its explicit policy to always try to bring new capable persons into the community;
• try to involve people who are in a position to solicit submitted papers on high quality research work, and who have the organizational machinery needed for a wide dissemination of calls for papers and calls for attendance.

Track Chairs work independently – this is important to maintain the overall coherence and stability of each area. For convenience Conference and PC Chairs may wish to use a common pool of PC members to draw upon to avoid unnecessary competition (between the Track Chairs) and undue complexity.

2.5 Invited speakers
The main scientific track of the conference should include 2-4 keynote talks by invited speakers. The invited speakers are chosen by the Conference and PC chairs.
2.6 Event chairs

Besides the main program, complementary events form part of the overall conference. These events are:

- Demos,
- Panels,
- Ph.D. Symposium,
- Posters,
- Project alignment
- Tutorials,
- Workshops,
- Industrial event

Chairs for these events (one or two per event) are selected by the Chair of the conference.

The Panel Chair defines the topic(s) of the panel(s), selects the panel moderator and optionally the participants; however, this task may also be carried out directly by the Conference Chair. A Panel Chair must again be a senior researcher that has an appropriate strategic view and/or openness to new and/or controversial topics. This chair is selected by the Conference Chair of the conference. Panel discussions may substantially contribute to the conference by creating interesting and enlightened discussions on novel or controversial topics. Too often, however, panel discussions have been boring and contributed little. If the Conference Chair and Program Committee Chairs are considering panel discussions, they must be fully aware of the need to prepare the discussions well, and to select good topics as well as stimulating, engaging and knowledgeable discussants. Preparations for a panel should not be carried out at the last minute, but rather well in advance — at the latest, at the time of the final program committee meeting. The recommendations here are:

- The Conference Chair and Program Committee Chairs should solicit proposals for panel discussions before the deadline of paper submissions.
• All panelists should have at least one written page stating their views and their position.

• The Program Committee Chairs should review the proposals of the panels, including the views and statements of the panelists. The program committees may, of course, generate their own panel discussion proposals as well.

• The final decision of which panels, if any, to include in the conference program is up to the Conference Chair.

• Panel Chair statements, as well as panel member position statements, should be published in the conference Proceedings.

• Panel discussions should be mainly discussions and not a series of paper presentations with little time left for panel-audience interaction.

• The panel Chair should avoid panelists not prepared to make a strong commitment to show up at the conference and to prepare him/herself for the discussion.

• The panel chairperson should select panel members, known to have differing views of the panel topic.

Special attention has to be drawn to the Workshop Chairs. Workshops can support existing areas and communities providing space and opportunity for more fruitful and interactive discussions than the main scientific program of the conference. Workshops especially also should be a means to detect new and promising trends in the research areas with the potential of becoming eventually a new major area of ESWC. Therefore, a senior person that has a certain strategic view and/or openness to new topics must be chosen as one of or as the Workshop Chair. Rather than rigorously filtering proposals a supportive attitude for new and arising issues is required. The choice of the Workshop Chairs requires approval by the Steering Committee.

2.7 Further chairs

A Finance Chair establishes together with the Local Chair (in case he/she exists) and the Conference Chair the conference budget. He/she is appointed by the President of STI International.
There may be a *Local Chair* that together with the CEO of STI International and the Conference Chair establishes the local arrangements for the conference. The selection process for this is outlined in section 4.9 “Conference Location”.

A *Proceedings Chair* provides support to the Program Committee Chairs in finalizing the proceedings of the conference. This chair is selected by the Program Committee Chairs.

A *Semantic Technology Chair* ensures the use of Semantic Technology during the event and supports dissemination channels such as the conference web site. The aim here is to use the conference as a convincing proof of Semantic Technology – to “eat our own dog-food”. The Semantic Technology Chair should have a profound technical knowledge of the state-of-the-art of semantic technology. He/she is selected by the Conference Chair.

A *Video Chair* organizes the video recording of the conference which should include online webcast, and publishing of the recording materials to one of the content distribution channels (like VideoLectures.NET, YouTube, iTunes). This chair should taking care about the whole activity around video-recording including contact with a video recording team, arranging signing copyright forms, setting up a cost plan, and taking care for the deployment of recorded materials on the Web. He/she is selected by the Conference Chair.

A *Sponsor Chair* seeks sponsorship for the conference. He/she is selected by the Conference Chair and approved by the financial chair.

A *Publicity Chair* promotes the conference and produces info material in cooperation with the STi2 office. He/she is selected by the Conference Chair and approved by the financial chair.
3. ESWC Steering Committee

The ESWC Steering Committee acts as an advisory board for the ESWC conference.

3.1 Tasks of the Steering Committee

For each conference the Steering Committee:

1. Selects the next General Chairs,
2. With the general Chair selects the PC Chairs,
3. Approves the Workshop Chairs,
4. Reviews the current ESWC event in general,
5. Reviews the areas of the conference series, and
6. Discusses strategic conclusions to be drawn for future events.

3.2 Work Format of the Steering Committee

The format of the work of the Steering Committee is defined as following:

- A phone conference 3 months before the conference to select the Conference Chair for the following year (Task 1).
- A phone conference 2 months before the conference to select and approve the PC chairs and the Workshop Chair (Task 2 and Task 3).
- A f2f meeting during the conference discussing Task 4-6;

\[1\] A preliminary conference report will be verbally presented by the Conference Chair.
followed by a working dinner.

### 3.3 Members of the Steering Committee

The ESWC Steering committee consists of:

- The Conference Chairs of each of the last four ESWC events.
- One PC for each of the last four ESWC events.\(^2\)
- A Chair who is either the President of STI International or a leading researcher selected by him/her.
- The STI President is invited as a guest in case s/he is not the Chair.
- The Conference and PC Chairs of the current event are invited as a guest without voting rights for the f2f meeting at the conference and the working dinner.
- The Track, Event, and Further Chairs may be invited as guests without voting rights for the f2f meeting at the conference and the working dinner.

Currently the members are:

1. John Domingue (Chair), The Open University, UK, and STI International, Austria; as STI president.
2. Sean Bechhofer, University of Manchester, UK; as PC Chair of ESWC2008.
3. Fabio Ciravegna, University of Sheffield, UK; as Chair of ESWC2009.

\(^2\) These PC chairs are selected by the steering committee. In case a PC Chair has been chosen as Conference Chair, the remaining PC Chair should become member of the Steering Committee.
4. Paolo Traverso, Center for Information Technology - IRST, IT; as PC Chair of ESWC2009.

5. Lora Aroyo, VU University Amsterdam, NL; as Chair of ESWC2010.

6. Eero Hyvönen, Helsinki University of Technology, FI; as PC Chair of ESWC2010.

7. Grigoris Antoniou, FORTH, GR; as Chair of ESWC2011.

8. Marko Grobelnik, Jožef Stefan Institute, SL; as PC Chair of ESWC2011.

3.4 Decision Procedure of the Steering Committee

Decisions are taken with majority of all votes that are not abstentions. The Chair of the Steering Committee only votes in cases of a stalemate.

3.5 Chair of the Steering Committee

The Chair of the ESWC steering committee:

- Leads the agenda of the f2f meetings during the conference,
- Organizes and chairs phone conferences,
- Represents the steering committee with regards to external requests,
- Will optionally select a local chair if required, and
- Invites external expert to participate as a guest in discussions with the Steering Committee (without voting rights).
4. Operational aspects

Here we specify further important details of running the ESWC conference series professionally.

4.1 Tasks and Deadlines

This section will contain a detailed list of important tasks and their attached deadlines. It will be written by the STi2 office till end of July 2010.

4.2 Email lists

The STi2 office will provide the following email lists for each ESWC conference:

- ESWC20XXchairs@sti2.org
- ESCW20XXPCchairs@sti2.org
- ESWC20XXTrackchairs@sti2.org
- ESWC20XXPC@sti2.org
- ESWC20XXEventchairs@sti2.org
- ESWC20XXFurtherchairs@sti2.org
- ESWC20XXall@sti2.org

The rules for running the mailing lists are defined by the Conference Chair.

STi2 also runs ESWCSteeringCommittee@sti2.org. The rules for running the mailing list are defined by the Chair of the Steering Committee.

4.3 Phone conferences

As mentioned earlier the conference calls are arranged by the Chair of the Steering Committee. If desired support for this can be provided by the STI International office (office@sti2.org).

4.4 Web Sites

The STi2 office will run the following web sites: a general web site on the conference series and one web site per specific ESWC event.
The structure of the Conference Series web site looks as following:

**Enriched Semantic Web Conference (ESWC)**

... *running text* ...

<table>
<thead>
<tr>
<th>Mission</th>
<th>Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>SC</td>
<td>Events (past+future)</td>
</tr>
</tbody>
</table>

The structure of a specific Conference web site looks as following:
4.5 Paper review process

Except for invited papers of invited speakers, each paper must be refereed normally by at least three (3) program committee members. Papers should be selected primarily on the basis of quality, although a balance of different topics should be taken into consideration as well. Reviews may use a standard or double-blind process (the reviewers do not know the names or organisations of the paper authors). Also, the review process may include a rebuttal phase where authors are given the chance to respond to initial reviewer-feedback. The definition of the exact review process is at the discretion of the programme chairs and should follow and incorporate good practices and experiences from the previous years with the goal of continuous improvement.

Acceptance quotas are set by the areas based on the number of submitted papers and historical acceptance rates. There are hard quotas for a limited number of
“unconditionally accepted” papers, and a soft quota for “may be accepted” papers. Acceptance of papers submitted by program committee members is permitted.

Paper may indicate more than one track they may fit or may be submitted for the “wrong” track. In this case the PC chair tries to find an optimal assignment of these papers per track.

There should be a **f2f meeting** of the Conference Chair, the PC Chairs, and the Track chairs where the final acceptance of papers is decided. The date and location of this meeting is communicated when Track chairs are invited to serve for the conference.

The **acceptance rate** of papers should be around 25%. Therefore, the number of accepted technical papers is normally about 65. We do not wish to formulate any particular recommendation about the detailed conference structure here. A problem may arise in the rare case where there are more than 65 papers with excellent reviews. The policy rule in this case is to “never reject a good paper”. The Conference and PC chairs have a free hand to structure the conference program to conform to this rule.

**Papers should not be judged harshly on English style and grammar.** Papers should not be rejected purely because the English is not good, unless the understanding the papers is severely impaired. When possible, personnel should be assigned to improve this type of paper to whatever extent possible.

Submissions should be accompanied by a **disclosure of prior publication or submission for publication** elsewhere, or intent to do so. In general, papers that are published in another conference or in a journal are not acceptable. However, if a paper is published only in a local conference or journal, it can still be accepted, provided the circulation of that publication is very limited.

**Invited papers** should be used very sparingly and in consultation with the Conference Chair. They are accepted without going through the normal refereeing process. However, to assure the technical quality of an invited paper, at least one program committee member should read it and suggest modifications if needed. Invited speakers should be informed that this will be done and that they are expected to cooperate. When an invited paper is low in quality, it is the Program Committee Chairs responsibility to assure that the quality be improved or the paper will not be accepted. This should occur in extremely rare cases.

It is recommended to use and pay for the premium version of Easy Chair as the **paper submission system**.
Given the fact that ESWC has multiple independent tracks it is important to emphasise that the paper submission process should be as easy as possible for paper authors and also allow for papers that may:

- be suitable for more than one track, and
- not fit easily into any given track – we want to avoid the situation that the conference is closed to ideas which do not fit into our current conceptualisation.

To satisfy the above we recommend that papers are submitted to a single place and which allows for authors to tag with relevant tracks (as opposed to having separate submission points for each track).

### 4.6 Best papers and 7-years-award

The conference should select best papers, include a session on best papers, and organize a special edition of a journal with extended versions of these best papers.

The Program Committee Chairs and the track chairs should select a small number (e.g., five) of high-quality papers from the conference as candidates for a “best of ESWC conference” special issue of a Journal on semantic technology. The authors of the selected papers should be invited to prepare extended versions of their papers, with at least 30 percent value-added technical material.

The Program Committee Chairs, in collaboration with the track chairs and possibly further PC members, should select a paper from the ESWC conference 7 years ago for the “7-years award”. The main criterion for this award is to what extent the paper has made an impact on the research community, by having fostered further high-quality work, or on industry, by having influenced standards, products, or other software that is widely used. The authors of the awarded paper should be invited to give a plenary presentation at the conference.

### 4.7 Conference Proceedings

Editors of the Conference proceedings are the Conference Chair and the PC Chairs. Track chairs should provide a section describing their area and the published papers in their tracks.

Conference Proceedings should be published with Springer. Individual papers should be made available on the web site of the conference.

### 4.8 Conference Material
The Conference has a *booklet* with standardized formats and standardized responsibilities. The following table specifies this structure:

<table>

</table>

The overall responsibility for this flyer is with the Conference Chair. We note here that mistakes and typos within the flyer do not create a good impression.

Parts of this information and/or abstracted presentations may be used to generate additional flyers.

Each participant should receive a name tag. This name tag should contain the name in readable size on both sides of the tag. It should also contain an RFID chip or similar technology and must have a quick-release mechanism preventing accidental strangulation.

### 4.9 Conference Location

We have a process model for organisations to apply to be a local host of ESWC. As this process is only now starting (in the summer of 2011) and normally a local host is appointed two years before a conference takes place we kick-start the process in the following way:

- ESWC 2012 – we stay in the same location as for 2011 in Crete.
• ESWC 2013 – we partially adopt the new model. Specifically, a public call is sent out with a 2011 autumn deadline. The calls are evaluated by the STI Board and the winning applicants are notified at the start of December of 2011.

ESWC 2014 – we fully adopt the new model. In December 2011 a public call is sent out with a deadline of end of February, 2012. The STI Board filters these to make sure that they pass a minimum criteria with respect to accessibility, budget and experience of local hosts. The filtered set are then presented at the following ESWC, in this case ESWC 2012, for a vote by the conference attendees. The successful applicant is then notified.

4.10 On-site organization

• Every day of the conference a small breakfast is provided starting 30 minutes before until 30 minutes after the conference. In addition, it should always be possible for participants to pick up some coffee at a place close to the reception area.

• The STi2 office should take care for the accommodation requirements of the Conference and Programme Chairs. The provided accommodation should reflect the importance of their role and work that they have carried out for a successful conference.

• The STi2 support stuff consult with the Conference Chair on how to arrange the Conference Dinner. This includes deciding on whether there are reserved tables and who will sit there. In case there are these tables one should define a priority in food supply and the quality of wine. During the conference dinner there must be a Conference Dinner Assistant provided by STi2 that supports the conference chair in any issues popping up during this challenging social event. To ensure a smooth termination of the conference dinner some secret reserve of legal drugs and musical instruments (including people able to use them) should be maintained by the Conference Dinner Assistant. All attendees of the Conference Dinner are strongly encouraged to wear fancy dress (a costume or masquerade). The Conference Chair will give a Dinner Speech during the Conference Dinner. Alternatively, he/she can choose a replacement speaker or an alternative entertaining performer(s), however, he/she will still remain personally liable for the quality of this performance.
5. Liabilities

Conference officials should be aware that they may become individually liable in case of violation of copyright laws, claims of plagiarism, and claims of slander, errors-and-omissions, trip-and-fall accidents, selection of unsafe carriers, to name the major risks. The officials are strongly advised to minimize their risks by taking an aggressive problem-prevention policy. This includes shifting the burden to authors by requiring them to sign copyright statements and transfer agreements; to participants by signing disclaimers on registration; by employing external organizations for providing all services not directly connected to running the conference, such as hotel reservation agencies or travel agencies, have these organizations assume responsibility for all corresponding risks, and place a corresponding disclaimer in the conference announcements; by having the organization providing and running the conference venue assume the risks connected with the conference locale.

The following disclaimer should be included in all conference publications: “The Organizing Committee of an ESWC conference nor the Steering Committee of the ESWC conference series are not liable for any loss or damage arising from the activities of this particular conference as exercised by its agents: conference organizers, carriers, proceedings, publications and programme committee.”

Officials must make sure that liability insurance is available to them to cover the remaining risks, and in particular to persons who are authorized to issue conference funds.

Acknowledgement. The VLDB conference series with their material has been a very valuable resource for our guidelines and we confess plagiarism. A big thank to these people, especially when they will ever go beyond optimizing queries over tables which they seem to plan to do.
